

ADMINISTRATIVO

Business plan

HR and administration software for Romanian SMEs,
sold as a subscription at **administrativo.ro**

Round	Pre-seed, €100,000 , all from the Vest Ventures Accelerator (ticket €100,000)
Valuation	€1,250,000 pre-money / €1,350,000 post-money (founders' proposal)
Applying to	Vest Ventures Accelerator (Timișoara), not Seed: the company has no revenue yet
Company	Romanian SRL owned by its two co-founders, Miroslav Maletici (CEO) and Răzvan Pervulescu (CTO)
Status, 6 Oct 2026	Product live in production since early September 2026; zero paying customers ; free pilots; accountant pilot programme opened 6 Oct 2026

Prepared 6 October 2026. Every figure dated after 6 October 2026 is a **projection** from the financial model (`financial-model.xlsx`) and is labelled as such. Market figures carry numbered sources listed in the appendix. Currency: EUR; RON converted at 5 RON = 1 EUR.

Confidential: prepared for the Vest Ventures application. Contact: contact@administrativo.ro

How to read this plan. Sections 1–10 describe what exists today and are written from the code repository and public sources. Sections 11–13 are the plan: every number there comes from the recalculated financial model and is a **PROJECTION** built bottom-up from pilots, accountant partners and direct trials. Section 14 lists the risks, including the ones that could stop the plan.

1 Executive summary

What we do. ADMINISTRATIVO is a multi-tenant web application that runs the employer side of HR and administration for a Romanian small or medium company: time tracking from the employee's phone, leave, personnel files, filing with **REGES-Online** (the Labour Inspectorate's mandatory electronic employee register) through its official API, occupational health and safety (**SSM**), onboarding, courses, performance reviews and KPIs, fleet, maintenance, inventory, IT ticketing, announcements, an employee portal and an AI help assistant. Payroll is built and is undergoing validation by an accountant. Customers switch on only the modules they need and pay a flat monthly price per company.

Why now. Since 1 January 2026, REGES-Online is the only valid employee register in Romania. Every hire, salary change, suspension and termination must be filed there, mostly within days; late or missing filing is fined up to 8,000 RON per person^[10]. When the deadline was extended in September 2025, only 23% of employers had migrated^[8]. About 526,000 Romanian companies employ at least one person^[1]. We expect that many of them still keep attendance, leave and HR files on paper or in Excel; no survey we know of measures this.

Where we are. Development started on 17 August 2026. The product has been live at administrativo.ro since early September 2026: 19 modules, 811 commits, 162 database migrations, and tenant isolation enforced by the database itself (row-level security forced on 160 of 164 tables). Transmission to REGES-Online through the API was confirmed working in production, for a real company, on 17 September 2026. We have **zero paying customers**; demo companies show the product to prospects. On 6 October 2026 we opened a pilot with up to 10 places for accounting practices (sign-up until 15 November 2026; none signed yet, two qualified conversations).

How we will sell. Accountants are the *strategic* channel: one practice can bring several client companies, and we expect employers to trust a tool their accountant recommends. In the base model the channel grows from 29% of new paying companies in year 1 to 45% in year 3: about 233 of 591 over 36 months. Direct trials from search, free tools and paid ads bring the rest. Their cost per trial and conversion are untested assumptions (Section 11).

The ask. A €100,000 pre-seed round at €1.25M pre-money. It pays every planned cost for 15 months with zero revenue, and on the base plan it carries the company to monthly break-even in Dec 2028 (month 24) without further funding. It funds a deliberately lean plan: both co-founders full time and unpaid in year 1 (€1,000 gross each from month 13), a partner manager for the accountant channel (half time from month 3, full time from month 13) and a half-time onboarding specialist from month 9. The developer is hired only after the seed. The goal is 100 paying companies by Apr 2028 (month 16), when we raise a seed round to grow faster, not to survive. Beyond the model, our ambition for 2031 is 2,000 paying companies and about €1.32M ARR, 3.7% of our serviceable market (Section 11.3).

€100k	15 months	448	5.7×
pre-seed round, all from Vest Ventures	runway with zero revenue (break-even Dec 2028 on plan)	paying companies at month 36 (base case, PROJECTION)	LTV/CAC, year 2 (base case, PROJECTION)

Honest summary of the weak points. No revenue and no paying customer yet; no signed pilot or letter of intent yet; the accountant channel is untested, and most modelled growth comes from direct and paid trials whose cost and conversion are assumptions; the conservative case (our previous base) is *not* default-alive and needs a seed round in Aug 2028; payroll legal values still need an accountant's sign-off; the code's IP is not yet assigned to the company in writing; Miroslav Maletici is today the SRL's sole associate; the legal basis of REGES-Online (HG 295/2025) was annulled at first instance in April 2026 (not final, still applicable); the plan covers Romania only; both co-founders are students. Section 14 shows how each is handled.

2 Company and founders

2.1 Legal entity

The company is a Romanian limited-liability company (SRL). The operator named on administrativo.ro is WISELEARNING S.R.L., Str. Metalurgiei nr. 2, Timișoara, Timiș county (CUI 50321210, J35/2618/2024), registered on 4 July 2024 and not VAT-registered. This SRL receives the round. Before ADMINISTRATIVO it ran small training activities (CAEN 8559, other education): turnover RON 2,800 in 2024 and RON 6,210 in 2025, no employees (annual accounts filed with ANAF). Before the round its main activity moves to software development (CAEN 6201; 62.10 under CAEN Rev. 3). Miroslav Maletici is today the sole associate; Răzvan Pervulescu enters the share capital before the round closes, so the two co-founders hold all the shares. There are no external investors and no options. The registered office in Timișoara meets Vest Ventures' West Region requirement^[27].

Intellectual property. The code has been written by the two co-founders. On 6 October 2026 no written assignment of that IP to the company has been signed. The assignment is part of the round's legal work and is signed before the round closes; it is listed as a risk in Section 14.

2.2 Founders

ADMINISTRATIVO has two co-founders. Both write and commit code to the product repository, and both are students at the Politehnica University of Timișoara (UPT). There is no formal partnership between the company and UPT.

Name	Role	Background and responsibilities
Miroslav Maletici	Co-founder, CEO	Student, Politehnica University of Timișoara; author of the first commit (17 Aug 2026). Leads product and sales
Răzvan Pervulescu	Co-founder, CTO	Student, Politehnica University of Timișoara; commits code to the product. Leads engineering

The plan assumes both co-founders work **full time** on ADMINISTRATIVO from the close of the round and take **no salary in year 1**; from month 13 (January 2028) each draws a deliberately lean gross salary of €1,000 per month (about RON 5,000, just above the full-time minimum wage). This keeps even the conservative case inside the runway of a €100k round. Vest Ventures asks whether founders can commit given other obligations^[27]: both co-founders commit their time full time to the company from the close, alongside their studies, and live on personal savings in year 1. Both live and work in Timișoara.

How the product is built. Development is AI-assisted: the repository carries Claude Code project tooling, a nightly multi-agent code review and automated documentation. We say this openly. It explains how two people shipped 19 modules in seven weeks, and it means the moat is not lines of code but regulatory depth, distribution, speed and, over time, data.

2.3 Planned team

Role	From model month	Gross, €/month
Co-founder and CEO, Miroslav Maletici: full time from month 1, unpaid until month 12	13 (Jan 2028)	1,000
Co-founder and CTO, Răzvan Pervulescu: full time from month 1, unpaid until month 12	13 (Jan 2028)	1,000
Partner and sales manager (accountant channel): half time, full time from month 13 (Jan 2028)	3 (Mar 2027)	2,000
Customer onboarding and support specialist: half time, full time from month 25 (Jan 2029)	9 (Sep 2027)	1,400
Full-stack developer, hired after the seed (not funded by this round)	25 (Jan 2029)	2,500

Source: financial model, *Assumptions*. Salaries are founders' assumptions; the gross column is the full-time equivalent, paid pro rata while a role is half time. Gross salaries rise 5% a year from year 2 (assumption); the employer adds the 2.25% work-insurance contribution (CAM), to be confirmed by the accountant.

3 Problem and regulatory context

3.1 The problem

A Romanian employer with 5 to 50 people carries the same legal paperwork as a large company, usually without an HR department. Our working hypothesis, not yet measured: the office manager or the owner keeps the daily attendance record, approves leave, tracks medical checks and safety briefings, watches vehicle inspection dates and sends personnel changes to the accountant, who may file them with the Labour Inspectorate; much of it lives in paper registers, Excel files and messaging apps. Mistakes surface when an inspector visits, and late or missing REGES filings are fined per employee^[10].

3.2 Regulatory drivers

Rule	What it requires
REGES-Online (HG 295/2025) ^[6]	Replaced the REVISAL desktop tool. Every employer files hires, salary and job changes, suspensions, secondments and terminations electronically. A new contract must be filed at the latest the day before work starts; salary changes within 20 working days; other changes within 3 working days ^[9] .
OUG 46/2025 ^[7]	Extended the migration deadline to 31 Dec 2025. Since 1 January 2026 REGES-Online is the only valid register; REVISAL was switched off. Only 23% of employers had completed the transition when the extension was granted ^[8] .
REGES API ^[29]	Unlike REVISAL, REGES-Online exposes an API to third-party software; each employer obtains its own API access.
Labour Code art. 119 ^[11]	Since 2017, every employer keeps a daily record of hours worked by each employee, with start and end times, and shows it to inspectors. The format is free (paper, Excel or software); an electronic timesheet is <i>not</i> mandatory.
Labour Code art. 34 ^[11]	The statutory obligation to keep a general employee register, independent of the HG that implements it.

Fines (in RON, the legal currency of the texts; EUR at 5 RON = 1 EUR):

Breach	RON	≈ EUR
Not enrolling in REGES-Online by the deadline ^[10]	15,000–20,000	3,000–4,000
Late or missing transmission of contract data, <i>per person</i> ^[10]	3,000–8,000	600–1,600
Incomplete or incorrect data ^[10]	3,000–6,000	600–1,200
No daily working-time record (Labour Code art. 260(1)) ^[11]	1,500–3,000	300–600

Risk to the thesis, disclosed. On 2 April 2026 the Constanța Court of Appeal annulled HG 295/2025 at first instance (Decision 83/2026). The ruling is not final; the request to suspend the HG was rejected, so REGES-Online remains applicable while the appeal is pending at the High Court of Cassation and Justice^[12]. No final ruling was found as of 6 October 2026. The duties to keep an employee register (art. 34) and a daily working-time record (art. 119) come from the Labour Code and do not depend on that case.

Tailwind, not yet law. The EU Pay Transparency Directive (2023/970) had to be transposed by 7 June 2026. Romania has a draft law (30 March 2026) still in Parliament; pay-gap reporting targets employers with 100+ staff^[13]. We treat it as a future reason to keep pay data structured, not as a current driver.

4 Product

ADMINISTRATIVO is a web application with a Romanian interface, built on Next.js and Supabase Postgres. Each company switches modules on or off; a module that is off disappears from the menu, from search and from its direct URL. One user can belong to several companies (for example an accountant with several clients) and switch between them without signing out.

4.1 Modules

Group	Modules (what is built and verified in code)
Core (always on)	Company, members and e-mail invitations, departments, org chart, work locations, personnel files, append-only audit log; Excel import of employees with column mapping and a per-row validation report.
HR	Attendance: monthly timesheet and weekly plan, overtime and night hours, approval, month locking; employees clock in from their phone, including by scanning a QR poster at the work location. Leave: configurable approval chain, automatic balances, public holidays excluded, 11 leave types, team calendar. REGES-Online (Section 4.3). Onboarding and offboarding templates. Courses with proof per item and recertification. Performance reviews and monthly KPIs .
Finance	Payroll: step-by-step gross-to-net calculation; all rates in dated, versioned settings tables; exports for the accountant (accounting note, D112 contributions return as XML, payroll register PDF, SEPA bank file). <i>Built, undergoing accountant validation.</i> Travel and per diem with country rates. Reports with Excel export.
Operations	Fleet: inspection, insurance and road-tax deadlines, trip sheets (the database blocks odometer regressions). Maintenance: servicing by date and by counter, fault reports, regulated-equipment (ISCIR) authorisations, parts and labour cost. Inventory with allocations the employee confirms. SSM: briefing matrix with due-date status, occupational medicine, accidents, fire extinguishers, protective equipment. IT ticketing.
Communication	Announcements to the whole company, with read confirmation and in-app notification.
Portal and help	Employee portal: own leave, attendance and clock-in, payslip, documents, courses, KPIs, tickets, travel. AI assistant (Section 4.5).

19 module keys in `src/config/features.ts`. What the product does *not* do: it files nothing with ANAF (the tax authority), keeps no general ledger, executes no payments, does not track the phone's location and has no badge-reader integration.

4.2 Architecture and security

- **Tenant isolation in the database, not only in the application.** Postgres row-level security is enabled on all 164 public tables and *forced* on 160 of them (the other four are global catalogues and identity tables), with 443 policies. Isolation between client companies is tested by SQL probes (30 files) that check both that nobody sees another company's data and that each role can still write what it should.
- **Encrypted sensitive data.** Personal numeric codes (CNP) and bank accounts (IBAN) are stored with AES-256-GCM, a random IV per value and key versioning. Reading them requires an explicit permission, and decryption for payroll exports leaves an audit row.
- **Append-only audit log**, enforced by a database trigger even for the service role.
- **Five roles** (platform admin, company admin, manager, HR, employee) with scoped permissions (none / own / team / all); every page and every server action checks them.
- **Legal values are data, not code:** payroll, leave, per-diem and working-time values live in dated, versioned tables, so a change in law is a settings change.

4.3 REGES-Online over the API

The REGES module composes the legally required events from the employee record (hire, salary, job, working-time and duration changes, suspension and resumption, secondment, termination, corrections) and queues them with their dependencies. It authenticates with each employer's own API credentials, stored encrypted and readable only by the server. Messages that carry an employee's personal numeric code are sent by a person with transmit rights; network errors are retried, rejected messages are not. Receipts and answers are reconciled back onto the employee record. Transmission through the production API was confirmed working on 17 September 2026. Each customer must first obtain API access from the REGES portal.

4.4 Mobile

Employees use the product from their phone. Today this is the browser, installable as a progressive web app (PWA). An Android app wrapping the employee portal is built (push notifications, biometric lock, QR scanner for clock-in) and in internal testing; it is *not* yet in Google Play, and there is no iOS app.

Top: monthly timesheet (desktop). Bottom left: employee portal clock-in card on a phone. Bottom right: clock-in screen opened by scanning the work-location QR poster. Screenshots from the demo company (fictitious employees).

4.5 AI assistant

An optional module answers “where do I do X?” and links to the right screen, filtered by the user’s own permissions; it also answers with the user’s real figures, such as a leave balance or pending approvals. It executes nothing. It runs on an external language model through OpenRouter and needs an API key, which is set in the production deployment configuration; each company switches the module on for itself.

4.6 Engineering evidence

Metric (repository, 6 Oct 2026)	Value
Commits since the first one on 17 Aug 2026	811
SQL migrations	162
Server actions (each through one 8-layer wrapper)	246
Unit and integration test cases (Vitest), static count	5,610 in 433 files
TypeScript lines under <code>src/</code> (production + tests)	237,693 + 90,473
Known open defect markers in tests	1 (payroll calculation)

5 Market analysis

5.1 The customers

Metric	Value	Year, source
Companies reporting at least one employee	≈526,000	FY2025 ^[1]
employees in those companies	3.88 million	FY2025 ^[1]
Active employees, all employers	5,586,187	Dec 2025 ^[4]
Active enterprises in industry, construction, trade and market services	693,447	2024 ^[3]
Enterprises with 10–19 persons employed	29,461	2023 ^[2]
Enterprises with 20–49 / 50–249 persons employed	17,288 / 7,632	2023 ^[2]
Micro-employers with 1–9 employees (DERIVED estimate)	≈470,000	mixed ^[1,2]
Accounting practices: firms + individual practitioners (DERIVED)	≈18,400	Dec 2024 ^[5]

Eurostat counts persons employed (owners included) and includes sole proprietors, so it is not mixed with the ICAP CRIF employer count in one ratio without saying so. The accountant figure comes from a search excerpt of the CECCAR report; the PDF itself is still to be opened and checked.

5.2 TAM, SAM, SOM

All three are DERIVED from sourced counts and our own list prices, at 5 RON = 1 EUR. They are not market-research figures.

	€/year	Formula and basis
TAM	188M	526,000 employers with ≥ 1 employee $\times$ 149 RON (HR core) $\times$ 12. Every employer needs at least the register, timesheet, leave and HR file ^[1] .
SAM	58M	29,461 firms with 10–19 persons $\times$ 398 RON $\times$ 12 + 24,920 firms with 20–249 persons $\times$ 499 RON $\times$ 12 ^[2] . Understated, because no price above 20 employees is published.
<i>SAM extension via accountants</i>	16.8M	$\approx$ 470,000 micro-employers $\times$ 10% reachable through accountants (ASSUMPTION) $\times$ 149 RON $\times$ 12. Shown separately, <i>not</i> added to SAM.
SOM (PROJECTION)	290k ARR	Base case at month 36 (Dec 2029): 448 paying companies $\times$ ARPA $\times$ 12, i.e. MRR at month 36 $\times$ 12. Equals 0.085% of employers. Conservative case: €179k; upside: €455k.

The SOM is built bottom-up in the financial model (pilots, then accountant partners, then direct trials), not as a share of the TAM.

6 Competition

Product (vendor)	What it is	REGES-Online	Public price
SmartBill Conta ^[14]	Cloud accounting for accountants, with payroll and D112	Yes, via API	€0–79 + VAT per client company/month by contract count
SAGA C / SAGA Web ^[15]	Desktop/web accounting and payroll used by accountants	Yes	Program free; web licences 600–2,500 RON/year (third-party summary)
Nexus Salarii ^[16]	Payroll, desktop/online	Yes, via API	Not public
NextUp Salarii ^[17]	Cloud payroll	Yes	Per employee, not public
qPlus ^[18]	HR documents, timesheet, REGES operations	Yes	Tiered; one tier 187.50 RON
Charisma HCM (TotalSoft) ^[19]	Enterprise HR and payroll, 600+ organisations	Not confirmed	Not public
colorful.hr (SD Worx) ^[20]	HR and payroll, 750 clients at acquisition	Not confirmed	Not public
Pontajj, PontajAngajati, epontez ^[21,22]	Time tracking only	No transmission	€9–49/month flat, or €1.4–2.4 per user
Factorial, Personio, BambooHR, Deel ^[23]	International HR suites	None found	€5–8 (Personio, estimate) to US\$25 per employee/month

“None found” / “Not confirmed” means no public evidence on 6 Oct 2026, not proof of absence. Prices as published by the vendor or a third party, see sources.

Where we fit.

1. Payroll plus REGES is crowded and owned by accountants (SmartBill Conta, SAGA, Nexus). We do not sell “another payroll”. We give the *employer* the daily HR work and hand the accountant clean data and exports.
2. Time-tracking apps are cheap point tools without REGES, personnel files or SSM.
3. Enterprise suites (Charisma, colorful.hr) target firms with 100+ employees and do not publish prices.
4. International suites have no Romanian payroll or REGES integration.

Our position: one subscription for the employer side of a 5–250 person company (phone clock-in, leave, HR file, SSM, fleet, inventory, onboarding, REGES over the API), which the accountant can also log into, at a flat price per company. The defensible core is depth in Romanian compliance and the accountant channel, not the code.

7 Business model and pricing

We sell a monthly subscription per company, priced flat (not per employee) up to 20 employees. The first month is free for any configuration; there is no setup fee. The seller is not VAT-registered, so prices are final.

Plan	RON/month	€/month	Model mix
HR core (attendance, leave, personnel file, employee portal)	149	29.8	45%
Extended HR (core + REGES, onboarding, courses, SSM, reviews, KPIs)	249	49.8	25%
Operations (core + fleet, maintenance, inventory, announcements, ticketing)	229	45.8	10%
Finance (core + payroll, per diem, reports)	219	43.8	5%
Whole application (all 15 add-ons)	499	99.8	15%

Prices from `src/content/landing/preaturi.ts`. Add-on modules cost 15–69 RON/month each (payroll 69). The plan mix is a model assumption; Finance is kept low while payroll is under validation. Blended list price in year 1: 238 RON (€47.6).

Revenue drivers. Paying companies × ARPA. In the base case ARPA is €49.98 in year 2, including a 5% yearly list-price/upsell increase from year 2 (**PROJECTION**).

Accountant economics. The accountant's own account is free. A referred company pays list price; the accountant earns **20% of that company's subscription for 6 months** from its first paid month. There is no multi-company discount.

Known limits of the model. No price is published above 20 employees (quote on request), so larger firms are modelled at list price, which understates their revenue. No billing or payment provider is integrated yet: invoicing is manual today, and integrating one is funded by the round.

8 Go-to-market

8.1 Channel 1: accountants (strategic)

Our hypothesis, to be tested in the pilot: most small employers already work with an accountant, and many accountants handle their clients' labour paperwork, including REGES filings. ADMINISTRATIVO would take the daily HR work off both of them: the employer records attendance, leave and changes; the accountant logs in with one account across clients and takes the exports. We call the channel strategic, not dominant: in the base model it brings 33% of new paying companies over 36 months (Section 11.2), rising from 24% in year 1 to 38% in year 3.

- **Pilot (opened 6 Oct 2026):** 10 places for accounting practices, sign-up until 15 Nov 2026, 1–3 client companies each, free until 31 Mar 2027. The team imports employees and sets up each company. Payroll enters the pilot only after the accountant validates the legal values. We ask for a 30-minute monthly feedback call and consent to an anonymised case description. As of 6 Oct 2026 no practice has signed yet.
- **After the pilot:** a partner and sales manager (half time from month 3, full time from month 13) signs practices. Model assumptions (base): a full-time manager signs 2.5 new partners a month in year 1, 4 in year 2 and 5 in year 3, and signings scale with the manager's hours, so year 1 runs at half that pace; each active partner refers one company every four months; 55% of referrals convert. That gives 19 / 67 / 127 active partners at months 12 / 24 / 36 (**PROJECTION**), under 1% of the ≈18,400 practices.

8.2 Channel 2: search and free tools

administrativo.ro offers 7 free tools without an account (salary calculator, leave request form, attendance register, review form, SSM briefing sheet, vehicle trip sheet, timesheet), 8 legal guides (including REGES-Online and working-time records), 19 module pages, 4 industry pages and a page for accountants. Search traffic has just started (Section 10). Model assumption: 6 organic trials a month in year 1, 16 in year 2, 27 in year 3; 27.5% of trials convert after the free month (**PROJECTION**; **untested**: no trial has been run yet).

8.3 Channel 3: direct and paid

Founder-led demos (/cere-demo), LinkedIn and paid search on REGES-Online and timesheet keywords. The marketing budget grows from €1,500 to €3,500 a month over three years; 60% of it goes to performance ads at an assumed €70 per trial (**PROJECTION**). Both the €70 per trial and the 27.5% trial conversion are **untested assumptions**: paid campaigns have not run yet. Paid conversions start in model month 2, and over 36 months the base case's 771 paid trials bring about 200 new paying companies, close to the accountant channel's about 233. This is the model's main sensitivity (Section 14).

8.4 Sequencing

1. Turn the pilot into evidence: signed pilot agreements, usage data, conversion on 1 April 2027.
2. Sell a narrow, legally safe core first (attendance, leave, REGES, SSM, employee portal); other modules are upsell.
3. Start selling payroll only after the accountant's validation (planned for month 5).
4. Region first (Timiș and the West Region), then national. Expansion to neighbouring markets is a hypothesis for after the seed round (Section 8.5).

8.5 International expansion (hypothesis)

Nothing in this round's numbers pays for a second country. We state the ambition and how we would test it.

- **Candidate markets:** Moldova, Serbia, Bulgaria and Hungary, the neighbouring markets whose teams Vest Ventures already accepts^[27]. Each has its own labour-law registers and payroll rules; we have not yet studied them.
- **What carries over as built:** the multi-tenant core with database-enforced isolation, legal values stored as dated settings data rather than code, attendance and clock-in, leave, personnel files, the structure of the health-and-safety, fleet, maintenance and inventory registers, onboarding, courses, reviews, ticketing and the employee portal.
- **What is country-specific:** the REGES-Online integration, payroll rules and statutory returns (such as D112), national leave and safety rules, and the interface language (Romanian only today).
- **Trigger and milestone:** a market scan of one neighbouring country after the seed round closes (after month 16 in the base case), funded by the seed, at zero cost in this round.

9 Operations and technology

- **Stack:** Next.js 16, React 19, TypeScript, Tailwind CSS, Supabase (Postgres 17) with forced row-level security. The application runs in Docker Swarm behind nginx on a virtual machine; the database is on Supabase cloud. A staging environment exists.
- **Quality gates:** CI runs typecheck, a server-boundary check, lint, format, the test suite, the build and a bundle check on every push. A nightly multi-agent AI review audits the previous day's commits; end-to-end tests run on staging.
- **Onboarding and support:** the team imports employees from Excel, sets up the company and maps accounting accounts with the accountant. The founders onboard the pilot companies themselves; from month 9 a half-time onboarding and support specialist with an HR/payroll background takes over (full time after the seed).
- **Office:** a coworking desk in Timiș county is budgeted from the round (an assumption in the model), to keep operating decisions in the West Region as Vest Ventures requires.
- **Compliance already in place:** published terms of service with a GDPR art. 28 data-processing annex (<https://administrativo.ro/legal/termeni>); the annex names the sub-processors that touch customer data.
- **Compliance work funded by the round:** round documents; a lawyer's review of the published terms and their GDPR art. 28 processing annex; assignment of the code's IP to the SRL (before the round closes); payroll legal values validated (months 2–5); accessibility audit to EN 301 549, which Vest Ventures requires for software built in its programme (months 5–6); professional liability insurance. The external penetration test is moved after the seed (month 26); until then security rests on the automated test suite, the database isolation checks and the nightly code review.
- **Infrastructure debt we will close:** one Supabase project serves both development and production today;

a separate production project is budgeted. A written procedure for encryption-key custody is still pending and must exist before the first paying tenant. Billing integration and automatic trial expiry are still to be built.

10 Current status and traction

Date	Event
17 Aug 2026	First commit
Early Sep 2026	Product live in production at administrativo.ro; search console set up (2 Sep)
5 Sep 2026	Android app build for internal testing
17 Sep 2026	Transmission through the REGES-Online production API confirmed working
6 Oct 2026	Accountant pilot programme opened and announced on LinkedIn

Metric (6 Oct 2026)	Value
Paying customers / MRR	0 / €0
Free pilot and demo companies	Demo companies only; no external company uses the product yet
Accounting practices signed for the pilot	0 (sign-up open until 15 Nov 2026)
Website visitors (Umami, 3 Sep–6 Oct)	≈7 genuine external visitors from Romania in a month
Google Search Console (since 2 Sep)	201 impressions, 3 clicks; average position improved from ≈50 to 5–20 by end of September
Largest query	“program salarizare” (payroll software): 43 impressions, position ≈61

10.1 Validation evidence

Evidence (6 Oct 2026)	Status
REGES-Online filing by a real employer	Transmission through the production API worked for a real company on 17 Sep 2026 (not named in this application)
Signed pilot agreements (accountant pilot)	0; up to 10 places, sign-up open until 15 Nov 2026
Letters of intent	None in this application
Qualified conversations with accountants and SMEs	2

Reading. We are pre-launch and SEO has just started. The evidence we can show today is execution: a broad product in production in seven weeks, a REGES-Online API integration that has filed for a real company, and security built into the database. We do not yet have the signed pilots or letters of intent that show validated demand. That is what the next weeks and months must produce: signed pilot agreements by 15 November 2026, usage data from pilot companies, and the first conversions to paid on 1 April 2027.

11 Financial plan

All figures in this section are projections from `financial-model.xlsx` (live formulas, recalculated, no formula errors). Model month 1 is January 2027, the assumed close of the round; the date of Vest Ventures Accelerator Cohort 3 is not published, so a later close shifts the whole timeline.

11.1 Three scenarios

PROJECTION	Conservative	Base	Upside
<i>Customers and recurring revenue</i>			
Paying companies, month 12	47	71	103
Paying companies, month 24	139	212	313
Paying companies, month 36	284	448	682
MRR, month 12	€2,254	€3,378	€4,892
MRR, month 24	€6,941	€10,751	€16,072
MRR, month 36	€14,881	€24,204	€37,888
ARR, month 36	€178,567	€290,452	€454,657
<i>Revenue and costs by model year (Jan–Dec)</i>			
Revenue, year 1 (2027)	€14,275	€21,254	€30,573
Revenue, year 2 (2028)	€56,648	€86,514	€127,797
Revenue, year 3 (2029)	€135,468	€217,268	€335,844
Costs, year 1 (2027)	€65,309	€66,169	€67,345
Costs, year 2 (2028)	€114,249	€117,172	€138,147
Costs, year 3 (2029)	€188,756	€196,761	€208,230
<i>Milestones and cash</i>			
30 paying companies	Aug 2027	May 2027	Apr 2027
100 paying companies	Aug 2028	Apr 2028	Dec 2027
300 paying companies	not in 36 months	May 2029	Dec 2028
Break-even (monthly cash flow ≥ 0)	not in 36 months	month 24 (Dec 2028)	month 22 (Oct 2028)
Runway with zero revenue	15 months	15 months	15 months
Runway on plan	21 months	more than 36 months	more than 36 months
Cash at month 36, without a seed round	–€63,986	€41,683	€175,550
Net cash flow, month 36	–€796	€7,535	€19,787

The round alone carries the base case; the seed accelerates it. On the base plan monthly cash flow turns positive in month 24 (Dec 2028) and cash never falls below €10k, even after the post-seed hires are counted without the seed money. At the 100-paying-company milestone (month 16, Apr 2028) the base model shows MRR of about €5.6k (ARR about €67k) and about €36k in cash: that is when we raise the seed, to hire the developer and scale the accountant channel. The conservative case, our previous base, is *not* default-alive: it reaches 100 paying companies in Aug 2028 with about €4k of cash left and needs the seed there; if the seed slips, the co-founders stop drawing their salaries again, which adds about two months (Section 14, financing risk).

11.2 New paying companies by channel

Base case, PROJECTION	Year 1	Year 2	Year 3	36 months
Via accountants (pilot conversions + partner referrals)	23	62	148	233
Direct (organic, search and paid trials after the free month)	57	118	183	358
New paying companies, total	80	180	331	591
Share via accountants	29%	34%	45%	39%

Source: financial-model.xlsx, sheet *Revenue*, rows “of which via accountants (pilot + partners)” and “New paying customers - direct”, summed by model year and rounded (the model works in fractional companies, so rows may not add up exactly). Trials over 36 months: 588 organic and 771 paid; both convert at an assumed 27.5%.

Main assumptions (base). Eight of the ten pilot places are filled, with two to three companies each; 60% of the pilot companies convert in April 2027; partner and organic acquisition as in Section 8; monthly logo churn 2.5%, a target to be tested in the pilot. ChartMogul’s median for products under US\$25 ARPA is 6.1%^[24]; our blended ARPA of about €50 is above that band, but 45% of modelled customers are on the €29.8 HR core

plan. Paid-trial cost (€70) and trial conversion (27.5%) are untested. The conservative case is our previous base: six pilot practices, 50% pilot conversion, slower partner signing, 3% churn and €80 per paid trial. The upside assumes all ten pilot places, faster acquisition, 2% churn and a developer from month 19 (sheet *Scenarios*). In every scenario the developer's start is tied to the seed.

11.3 Ambition beyond the model (2031)

The financial model stops at month 36 (December 2029) with 448 paying companies in the base case. Our ambition for 2031, two years after the model ends and with the seed round invested, is **2,000 paying companies** and about **€1.32M ARR** (at about €55 a month per company). That is 3.7% of the 54,381 Romanian firms with 10–249 people, or 0.38% of all 526,000 employers. It is a target, not a projection: it assumes the accountant channel scales nationally after the seed and that neighbouring markets (Section 8.5) are not needed to get there.

11.4 Unit economics (base case, year 2: Jan–Dec 2028)

Metric	Value	Definition / benchmark
ARPA	€50.69/month	Average revenue per paying company
Contribution margin	95.0%	(ARPA – variable infrastructure – payment fees) / ARPA
Gross margin, P&L basis	79.8%	After fixed hosting and the onboarding/support salary. Not an efficiency gain: the support specialist is half time in year 2 and full time again after the seed
CAC, fully loaded	€339	Partner manager salary + marketing + travel + commissions, per new paying company
CAC, paid ads only	€255	Cost per trial / trial conversion (both untested assumptions)
Monthly logo churn	2.5%	Target, to be tested. Benchmark 6.1% median for ARPA < US\$25 ^[24]
LTV	€1,927	ARPA × contribution margin / churn
LTV / CAC	5.7×	LTV divided by fully loaded CAC
CAC payback	7 months	SMB SaaS median ≈11 months, 6–14 healthy; 3–9 typical below US\$5k ACV, so ours is above that ^[25]

11.5 Runway

With zero revenue the round pays every planned cost for **15 months**. On the base plan cash never runs out within the 36 months (lowest point €10k, after the post-seed hires); in the conservative case it lasts **21 months**. Cash in the company before the round is set to zero (prudent; the SRL held about RON 1,900 at the end of 2025). Today the founders spend under €200 a month on hosting and tools.

12 Funding requirement and use of funds

12.1 The round

Stage	Pre-seed. We apply to the Vest Ventures Accelerator (ticket €10k–200k ^[27]), not to Seed, because we have no revenue.
Amount	€100,000 , a single Vest Ventures Accelerator ticket; Vest Ventures is the only investor in the round
Valuation	€1,250,000 pre-money, €1,350,000 post-money (founders' proposal)
Instrument	Convertible loan agreement (CLA) or shareholders' agreement (SHA) on Vest Ventures' templates; a CLA would use the €1.25M pre-money as its valuation cap.
State aid	Vest Ventures invests under <i>de minimis</i> (ceiling €300k per undertaking over three years ^[28]); prior aid received: none
Founder vesting	None today. To be agreed in the investment agreement (for example 4 years with a 1-year cliff for both co-founders)
Company history	Registered in 2024; revenue and result for FY2024 and FY2025 are given in Section 2 once confirmed, and the balance sheets go into the data room
Tax regime in the model	Micro-enterprise tax of 1% of revenue, to be confirmed by the accountant (1% or 3% depends on activity code and revenue)
IP	Assignment of the code's IP to the company: not yet signed; signed before the round closes

Why €1.25M pre-money. We found no sourced Romanian or CEE pre-seed valuation benchmark. The figure is our proposal for a company with a live product, filings already made through the state API, zero revenue and student founders. The round is below the 2025 Romanian average pre-seed round of €526k (average seed: €1.5M)^[26].

Structure. In an SRL, amending the articles (for example, a capital increase for the next investor) needs every associate's vote unless the articles say otherwise. At the round we will either amend the articles to majority decisions with drag-along, or convert to an SA or a holding structure; the choice is settled with a lawyer at closing.

12.2 Why €100,000 and not less or more

Round tested	Runway, zero revenue	Runway on plan
€75,000: smaller Vest Ventures ticket	12 months	19 months
€100,000: proposed	15 months	> 36 months
€150,000: larger ticket, same plan	20 months	> 36 months

We ask for the smallest ticket that reaches the seed trigger, not for the largest cheque available. €100k is also the typical Vest Ventures Accelerator ticket reported in the press^[27]. The co-founders work unpaid in year 1 and on €1,000 gross each afterwards, the partner manager works half time until month 13 (and the model scales partner signings down with the manager's hours), the support specialist starts half time in month 9, the penetration test moves after the seed, and the developer is hired only after the seed. Every cut falls on cost, not on growth. On the base plan the round reaches 100 paying companies (month 16, Apr 2028) and monthly break-even (Dec 2028) without further funding. Even the conservative case reaches 100 paying companies inside its 21-month runway, with a thin margin (Section 14). A €75k ticket lasts 19 months on the base plan, but the conservative case would run out of cash before its trigger. A €150k ticket adds little on the base plan: we would rather raise the seed on measured traction than spend a larger pre-seed.

12.3 Use of funds

Category	€	%
Product and engineering (2 co-founders full time)	6,803	6.8
Accountant channel and sales (partner manager, travel, commissions)	22,295	22.3
Marketing (content, SEO, performance ads)	26,931	26.9
Legal, payroll validation, compliance and security	18,482	18.5
Customer onboarding and support	5,405	5.4
Operations and contingency	8,722	8.7
Infrastructure and tools	11,362	11.4
Total	100,000	100.0

Each category's share of planned spend over the zero-revenue runway (months 1–15), applied to the round. Revenue earned in that period extends the runway. The developer is not in this budget: the role is hired after the seed.

13 Milestones and KPIs

Month	Milestone (base case, PROJECTION)
M1 (Jan 2027)	Pre-seed round closes (assumed); both co-founders full time, unpaid
M3 (Mar 2027)	Partner and sales manager hired (accountant channel), half time
M4 (Apr 2027)	Accountant pilot ends (free until 31 Mar 2027); pilot companies convert to paid (the founders onboard them)
M5 (May 2027)	Payroll legal values validated by an accountant; payroll becomes sellable; 30 paying customers
M6 (Jun 2027)	Accessibility audit (EN 301 549) completed
M9 (Sep 2027)	Customer onboarding and support specialist hired, half time
M13 (Jan 2028)	Co-founders start drawing a salary; partner and sales manager full time
M16 (Apr 2028)	100 paying customers: seed raise starts (including Vest Ventures Seed)
M24 (Dec 2028)	Monthly break-even on the pre-seed alone
M25 (Jan 2029)	After the seed: developer hired; onboarding and support specialist full time
M26 (Feb 2029)	External penetration test, funded by the seed
M29 (May 2029)	300 paying customers

KPI (base case, PROJECTION)	Month 12	Month 24	Month 36
Paying companies	71	212	448
MRR	€3,378	€10,751	€24,204
ARR	€40,536	€129,013	€290,452
Active accountant partners	15	51	99

Monthly we will also track: pilot-to-paid conversion (assumed 60%), trial-to-paid conversion (assumed 27.5%), monthly logo churn (target at most 2.5%), CAC payback (target about 7 months), REGES messages transmitted per active company, and weekly active employees per company. Each assumption in the model is a named input, so actual results replace assumptions as they arrive.

14 Risks and mitigations

Risk	Mitigation
Regulatory: HG 295/2025 was annulled at first instance (2 Apr 2026, not final); REGES rules or deadlines could change	The register (Labour Code art. 34) and daily timesheet (art. 119) are statutory and do not depend on the case. REGES is one module, not the whole product. Legal values live in versioned settings tables, so rule changes are configuration.
Payroll validation: every payroll legal value is still marked "to be confirmed"; one known calculation defect is open	Payroll is not sold until an accountant validates it (budgeted, month 5). The Finance package is only 5% of the plan mix. The pilot runs without payroll.
No market validation yet: zero paying customers, no signed pilot or letter of intent; the accountant channel is untested	Pilot with up to 10 practices (sign-up until 15 Nov 2026; 0 signed on 6 Oct, two qualified conversations; base case assumes 8, conservative 6); pilot conversion measured on 1 April 2027; the model's assumptions are explicit inputs and the conservative case is shown.
Acquisition assumptions: most modelled new companies come from direct trials; paid trials at €70 each converting at 27.5% have never been tested; paid conversions start in model month 2	This is the model's key sensitivity. Paid budget is spent in small, measured steps from month 1; cost per trial and conversion are named inputs and are replaced by measured values after the first campaigns. If paid trials cost more or convert less, the paid budget is cut and the plan leans on the accountant channel and search, which moves the base case towards the conservative case.
Financing (seed): the base case is carried by the round alone, but the conservative case needs a seed round: at its 100-paying-company trigger (Aug 2028) about €4k of cash is left and cash turns negative two months later	The seed raise starts at 100 paying companies (Apr 2028 in the base case), or four months before the conservative trigger if the pilot tracks the conservative case; the Vest Ventures Seed stage is one route. No seed amount or valuation has been discussed yet. Levers not modelled: the co-founders stop drawing their salaries again (about two more months); the paid-ads budget may be cut, and its effect on runway can be tested in the workbook.
Single market: Romania only; REGES is Romania-specific; the UI is in Romanian	Romanian compliance depth is the defensible core. Expansion to neighbouring countries (Moldova, Serbia, Bulgaria, Hungary) is a hypothesis for after the seed (Section 8.5), not part of this plan's numbers.
IP assignment: the code was written by the co-founders and is not yet assigned to the company in writing	A written IP assignment from both co-founders to the SRL, signed before the round closes, as part of the round's legal work; Răzvan Pervulescu enters the share capital at the same time.
Competition: accountant-owned payroll tools (SmartBill, SAGA, Nexus) and cheap time-tracking apps	We do not compete on payroll; we serve the employer's daily HR work and give the accountant exports and a login. Flat price per company is simple for micro-firms.
Founder time: both co-founders are students	Full-time commitment from the close is a condition of the plan; they are unpaid in year 1, live on personal savings, and are paid from month 13.
Key person: two founders hold all product knowledge	Developer hired after the seed (month 25 in the base case); code, migrations and architecture are documented in the repository; CI and tests guard changes.
Pricing ceiling: flat price, no published price above 20 employees	A price for larger companies is to be defined; the model understates revenue from them.
Security and infrastructure: HR data is sensitive; one database project serves dev and prod; the AI assistant depends on an external model	Forced RLS, encryption, audit log; separate production database, external pentest and key-custody procedure funded; the assistant is optional and executes nothing.
Timing: the Cohort 3 date is unknown	The model starts at the close; a later close shifts the timeline but not the runway.
